### Openstack Installation

### **Basic Tests**

Allegato Manuale di Installazione

Ver.

### **INDICE DEGLI ARGOMENTI**

1.	VERIFY THE IDENTITY SERVICE (KEYSTONE)	3
2.	VERIFY THE IMAGE SERVICE (GLANCE)	9
3.	VERIFY THE COMPUTE SERVICE (NOVA)	10
4.	VERIFY THE BLOCK STORAGE SERVICE (CINDER)	16
5.	VERIFY THE NETWORKING SERVICE (NEUTRON)	21
6.	VERIFY THE SERVICES ON THE COMPUTE NODES	24
7.	END-TO-END TEST: VM INSTANTIATION	26

Allegato Manuale di Installazione

Ver.

### 1. Verify the Identity Service (Keystone)

The following steps allow to verify the correct installation of the Openstack Identity Service:

1. if set, clear OS\_SERVICE\_TOKEN and OS\_SERVICE\_ENDPOINT environment variables:

\$ unset OS\_SERVICE\_TOKEN OS\_SERVICE\_ENDPOINT

2. Request an authentication token by using the admin user and the password you chose for that user:

\$ keystone --os-username=admin --os-password=\$ADMIN\_PASS --os-auth-url=http://<controller\_ip>:35357/v2.0 token-get

In response, you should receive a token paired with your **user ID**. This verifies that the Identity Service is running on the expected endpoint and that your user account is established with the expected credentials.

The expected output is shown hereafter:

++

#### Allegato Manuale di Installazione

Ver.

You can also set your --os-\* variables in your environment to simplify command-line usage.

For the following tests, create an admin-openrc.sh file in your home directory, with the following content:

```
export OS_USERNAME=admin
export OS_PASSWORD=$ADMIN_PASS
export OS_TENANT_NAME=admin
export OS_AUTH_URL=http://<controller_ip>:35357/v2.0
```

Allegato Manuale di Installazio
---------------------------------

Ver

### 2. Verify the Image Service (Glance)

Preparation:

Set your --os-\* variables in your environment:

```
$ source admin-openrc.sh
```

The following steps allow to verify the correct installation of the Openstack Image Service:

1. Verify that the Glance API is correctly configured and working:

```
$ glance image-list
```

If you have not uploaded any image yet, the output of this command will show an empty table; otherwise you will get the list of registered images.

2. Verify that the Glance registry process is working correctly by importing the Cirros image available online:

```
$ wget http://cdn.download.cirros-cloud.net/0.3.2/cirros-0.3.2-x86_64-disk.img
$ glance image-create --name "cirros-0.3.2-x86_64" --disk-format qcow2 --container-format bare --is-public
True --progress < cirros-0.3.2-x86_64-disk.img</pre>
```

3. Check the status of the image using the ID returned by the previous command:

```
$ glance image-show <image_id>
```

Allegato Manuale di Installazio
---------------------------------

ν	e	r	

### 3. Verify the Compute Service (Nova)

Preparation:

Set your --os-\* variables in your environment:

```
$ source admin-openrc.sh
```

The following steps allow to verify the correct installation of the Openstack Compute Service:

1. Verify that all nova processes are up and running:

```
$ for s in /etc/init.d/nova-*; do status $(basename $s); done
```

The expected output is like the following:

```
nova-api start/running, process 26601
nova-cert start/running, process 26615
nova-conductor start/running, process 26625
nova-consoleauth start/running, process 26659
nova-novncproxy start/running, process 26669
nova-scheduler start/running, process 26643
```

If one or more of the above processes are stopped, look at the log files in the folder /var/log/nova in order to find the problem.

2. To verify your configuration, list available images:

#### Allegato Manuale di Installazione

Ver.

\$ nova image-list

The output should be like this:

- 3. Verify the process "nova-cert" is running and connected to the database and messaging server (AMQP):
  - a. Verify the connection with the database (replace the DB\_PORT value with the correct value depending on your installation. Default is 3306)

```
# export DB_PORT=3306
# netstat -punt | grep -s $DB_PORT | grep -s $(pgrep nova-cert)
```

The expected output shows the ESTABILISHED connection:

tcp 0 0 90.147.75.205:39263 212.189.205.99:33306 **ESTABLISHED** 23311/python

#### Allegato Manuale di Installazione

Ver.

b. Verify the connection with the messaging server (replace the AMQP\_PORT value with the correct value depending on your installation. Default is 5672)

```
# export AMQP_PORT=5672
# netstat -punt | grep -s $AMQP_PORT | grep -s $(pgrep nova-cert)
```

The expected output shows the ESTABILISHED connection:

tcp	0	0 90.147.75.205:52498	90.147.75.68:5672	ESTABLISHED 23311/python	
-----	---	-----------------------	-------------------	--------------------------	--

- 4. Verify the process "nova-scheduler" is running and connected to the database and messaging server (AMQP):
  - a. Verify the connection with the database (replace the DB\_PORT value with the correct value depending on your installation. Default is 3306)

```
# export DB_PORT=3306
# netstat -punt | grep -s $DB_PORT | grep -s $(pgrep nova-scheduler)
```

The expected output shows the ESTABILISHED connections:

tcp	0	0 90.147.75.205:39303	212.189.205.99:33306	ESTABLISHED 23943/python
tcp	0	0 90.147.75.205:39355	212.189.205.99:33306	ESTABLISHED 23943/python

#### Allegato Manuale di Installazione

Ver.

b. Verify the connection with the messaging server (replace the AMQP\_PORT value with the correct value depending on your installation. Default is 5672)

```
# export AMQP_PORT=5672
# netstat -punt | grep -s $AMQP_PORT | grep -s $(pgrep nova-scheduler)
```

The expected output shows the ESTABILISHED connections:

tcp	0	0 90.147.75.205:52528	90.147.75.68:5672	ESTABLISHED 23943/python	
tcp	0	0 90.147.75.205:53220	90.147.75.68:5672	ESTABLISHED 23943/python	

- 5. Verify the process "nova-consoleauth" is running and connected to the database and messaging server (AMQP):
  - a. Verify the connection with the database (replace the DB\_PORT value with the correct value depending on your installation. Default is 3306)

```
# export DB_PORT=3306
# netstat -punt | grep -s $DB_PORT | grep -s $(pgrep -f /usr/bin/nova-consoleauth)
```

The expected output shows the ESTABILISHED connections:

#### Allegato Manuale di Installazione

Ver.

tcp	0	0 90.147.75.205:39257	212.189.205.99:33306	ESTABLISHED 23532/python	
-----	---	-----------------------	----------------------	--------------------------	--

b. Verify the connection with the messaging server (replace the AMQP\_PORT value with the correct value depending on your installation. Default is 5672)

```
# export AMQP_PORT=5672
# netstat -punt | grep -s $AMQP_PORT | grep -s $(pgrep -f /usr/bin/nova-consoleauth)
```

The expected output shows the ESTABILISHED connections:

tcp	0	0 90.147.75.205:43638	90.147.75.68:5672	ESTABLISHED 23532/python
tcp	0	0 90.147.75.205:52524	90.147.75.68:5672	ESTABLISHED 23532/python
tcp	0	0 90.147.75.205:52696	90.147.75.68:5672	ESTABLISHED 23532/python
tcp	0	0 90.147.75.205:53833	90.147.75.68:5672	ESTABLISHED 23532/python

6. Verify the process "nova-novnc" is running and listening on its port (default is 6080):

```
# netstat -a | grep -s 6080
```

Allegato Manuale di Installazio
---------------------------------

Ver.

The expected output is like the following:

tcp 0 0 preprod-01.ba.infn:6080 *:*	
-------------------------------------	--

	Allegato	Manuale	di	Installazione
--	----------	---------	----	---------------

Ver.

### 4. Verify the Block Storage Service (Cinder)

Preparation:

Set your --os-\* variables in your environment:

\$ source admin-openrc.sh

The following steps allow to verify the correct installation of the Openstack Block Storage Service:

1. Verify that all cinder processes are up and running:

\$ for s in /etc/init.d/cinder-\*; do status \$(basename \$s); done

The expected output is like the following:

cinder-api start/running, process 30050
cinder-scheduler start/running, process 30087
cinder-volume start/running, process 30127

If one or more of the above processes are stopped, look at the log files in the folder /var/log/cinder in order to find the problem. Note: depending on your installation, the cinder-volume process may not be running on the controller node (if you have decided to deploy it on a dedicated host, you should check its status there: ssh <cinder-host> service cinder-volume status).

7. Verify the process "cinder-scheduler" is running and connected to the database and messaging server (AMQP):

#### Allegato Manuale di Installazione

Ver.

a. Verify the connection with the database (replace the DB\_PORT value with the correct value depending on your installation. Default is 3306)

```
# export DB_PORT=3306
# netstat -punt | grep -s $DB_PORT | grep -s $(pgrep -f /usr/bin/cinder-scheduler)
```

The expected output shows the ESTABILISHED connections:

tcp	0	0 90.147.75.205:45718	212.189.205.99:33306	ESTABLISHED 23943/python
tcp	0	0 90.147.75.205:45812	212.189.205.99:33306	ESTABLISHED 23943/python

b. Verify the connection with the messaging server (replace the AMQP\_PORT value with the correct value depending on your installation. Default is 5672)

```
# export AMQP_PORT=5672
# netstat -punt | grep -s $AMQP_PORT | grep -s $(pgrep -f /usr/bin/cinder-scheduler)
```

The expected output shows the ESTABILISHED connections:

tcp	0	0 90.147.75.205:52528	90.147.75.68:5672	ESTABLISHED 23943/python
tcp	0	0 90.147.75.205:53220	90.147.75.68:5672	ESTABLISHED 23943/python

Allegato	Manuale	di Installazione	
----------	---------	------------------	--

Ver.

8. Finally, to verify that cinder is configured properly, create a new volume:

\$ cinder create --display-name test 1

The expected output is like the following:

+		+-		_+
	Property	·   	Value	
	attachments		[]	
	availability_zone		nova	
1	bootable		false	
1	created_at		2014-06-22T01:14:02.705154	
1	display_description		None	
1	display_name		test	
1	encrypted		False	
1	id		ad2f9004-3939-4b1c-a234-8ab26b8fe961	
	metadata		{}	
	size		1	

Allegato Manuale di Installazion	azione	talla	Ins	di	anuale	Ma	ato	lled	Α

Ver.

	snapshot_id		None		
I	source_volid		None		
	status		creating		
1	volume_type		None		
+		+		+	

9. Check the volume status using the command "cinder list". The status should pass from "creating" to "available":

\$ cinder list

The expected output is like the following:

+		++	+		+	+-		
+								
ID	Status	Display Name	Size	Volume	Type   Boo	table	l Attac	rhed
' .	Deacus	Dispidy Name	1 5126	VOTUNE	Type   Boo	CUDIC	Mccac	Jiica
to								
+		++	+		+	+		
+								
ad2f9004-3939-4b1c-a234-8ab26b8fe961	available	test	1		None	I	false	
	•	'	'	'				
cfe55712-5933-42fe-b9a2-aacaa8620cd6	creating	test	1	.	None	I	false	
	,	•	,			·		

#### Allegato Manuale di Installazione

v ei				

+	+	+	
+			

If the status value is not available, the volume creation failed. Check the log files in the /var/log/cinder/ directory on the controller and volume nodes to get information about the failure.

### 5. Verify the Networking Service (Neutron)

Preparation:

Set your --os-\* variables in your environment:

```
$ source admin-openrc.sh
```

The following steps allow to verify the correct installation of the Openstack Networking Service. In this guide we assume that the networking services have been deployed onto a dedicated node (network node); therefore the following commands should be issued on the network node.

1. Verify that all neutron processes are up and running:

```
$ for s in /etc/init.d/neutron-*; do status $(basename $s); done
```

The expected output is like the following:

```
neutron-dhcp-agent start/running, process 7515

neutron-l3-agent start/running, process 7529

neutron-metadata-agent start/running, process 7537

neutron-ovs-cleanup start/running

neutron-plugin-openvswitch-agent start/running, process 7812

neutron-server start/running, process 7820
```

If one or more of the above processes are stopped, look at the log files in the folder /var/log/neutron in order to find the problem.

#### Allegato Manuale di Installazione

Ver

2. Query the neutron API to get the list of networks:

```
$ neutron net-list
```

The expected output shows the list of the available networks (if any).

- 3. Verify the process "neutron-dhcp-agent" is running and connected to the messaging server (AMQP):
  - a. replace the AMQP PORT value with the correct value depending on your installation. Default is 5672

```
# export AMQP_PORT=5672
# netstat -punt | grep -s $AMQP_PORT | grep -s $(pgrep -f /usr/bin/neutron-dhcp-agent)
```

The expected output shows the ESTABILISHED connections:

tcp	0	0 90.147.75.218:47911	90.147.75.68:5672	ESTABLISHED 14058/python
tcp	0	0 90.147.75.218:47912	90.147.75.68:5672	ESTABLISHED 14058/python
tcp	0	0 90.147.75.218:47910	90.147.75.68:5672	ESTABLISHED 14058/python

- 4. Verify the process "neutron-I3-agent" is running and connected to the messaging server (AMQP):
  - b. replace the AMQP\_PORT value with the correct value depending on your installation. Default is 5672

```
# export AMQP_PORT=5672
```

#### Allegato Manuale di Installazione

### 6. Verify the services on the Compute Nodes

Check that the compute and networking agents are up and running and able to communicate with the controller. Use the commands "nova service-list" and "neutron agent-list" (they can be issued from the controller node).

1. Load the admin credentials:

```
$ source admin-openrc.sh
```

2. verify that all the compute nodes are up:

```
$ nova service-list | grep nova-compute
```

nova-compute	preprod-05   nova	enabled   up	2014-11-10T12:30:30.000000   None	
nova-compute	preprod-03   nova	enabled   <b>up</b>	2014-11-17T15:49:45.000000   None	1
nova-compute	preprod-04   nova	enabled   <b>up</b>	2014-11-17T22:48:51.000000   None	

3. verify that the neutron open-vswitch agent is running on the compute nodes:

```
$ neutron agent-list | grep vSwitch
```

The output shows ":-)" if the service is working fine or "xxx" if there are problems

156c3	d5-f685-450a-8fef-1bf9ca3c1e0f	Open	vSwitch	agent	preprod-05	:-)	True

#### 7. End-to-End test: VM instantiation

The following bash script can be used to check that the installed Openstack infrastructure is able to provide running virtual machines.

To execute the script you must fill the variables at the beginning of the file with proper values depending on your installation.

IMAGE\_ID

To set the IMAGE\_ID variable you can use the command "glance image-list" to list the available image ids.

FLAVOR ID

To set the FLAVOR variable you can use the command "nova flavor-list" to list the available flavors (both the flavor name and id can be used).

KEY\_NAME

To set the KEY\_NAME variable you can use the command "nova keypair-list" to list the available keypairs

NET\_ID

To set the NET\_ID variable you can use the command "neutron net-list" to list the available networks.

#!/bin/bash

# BEFORE RUNNING THIS SCRIPT FILL THE

# FOLLOWING VARIABLES WITH PROPER VALUES

#### Allegato Manuale di Installazione
